

Meteor astrometry

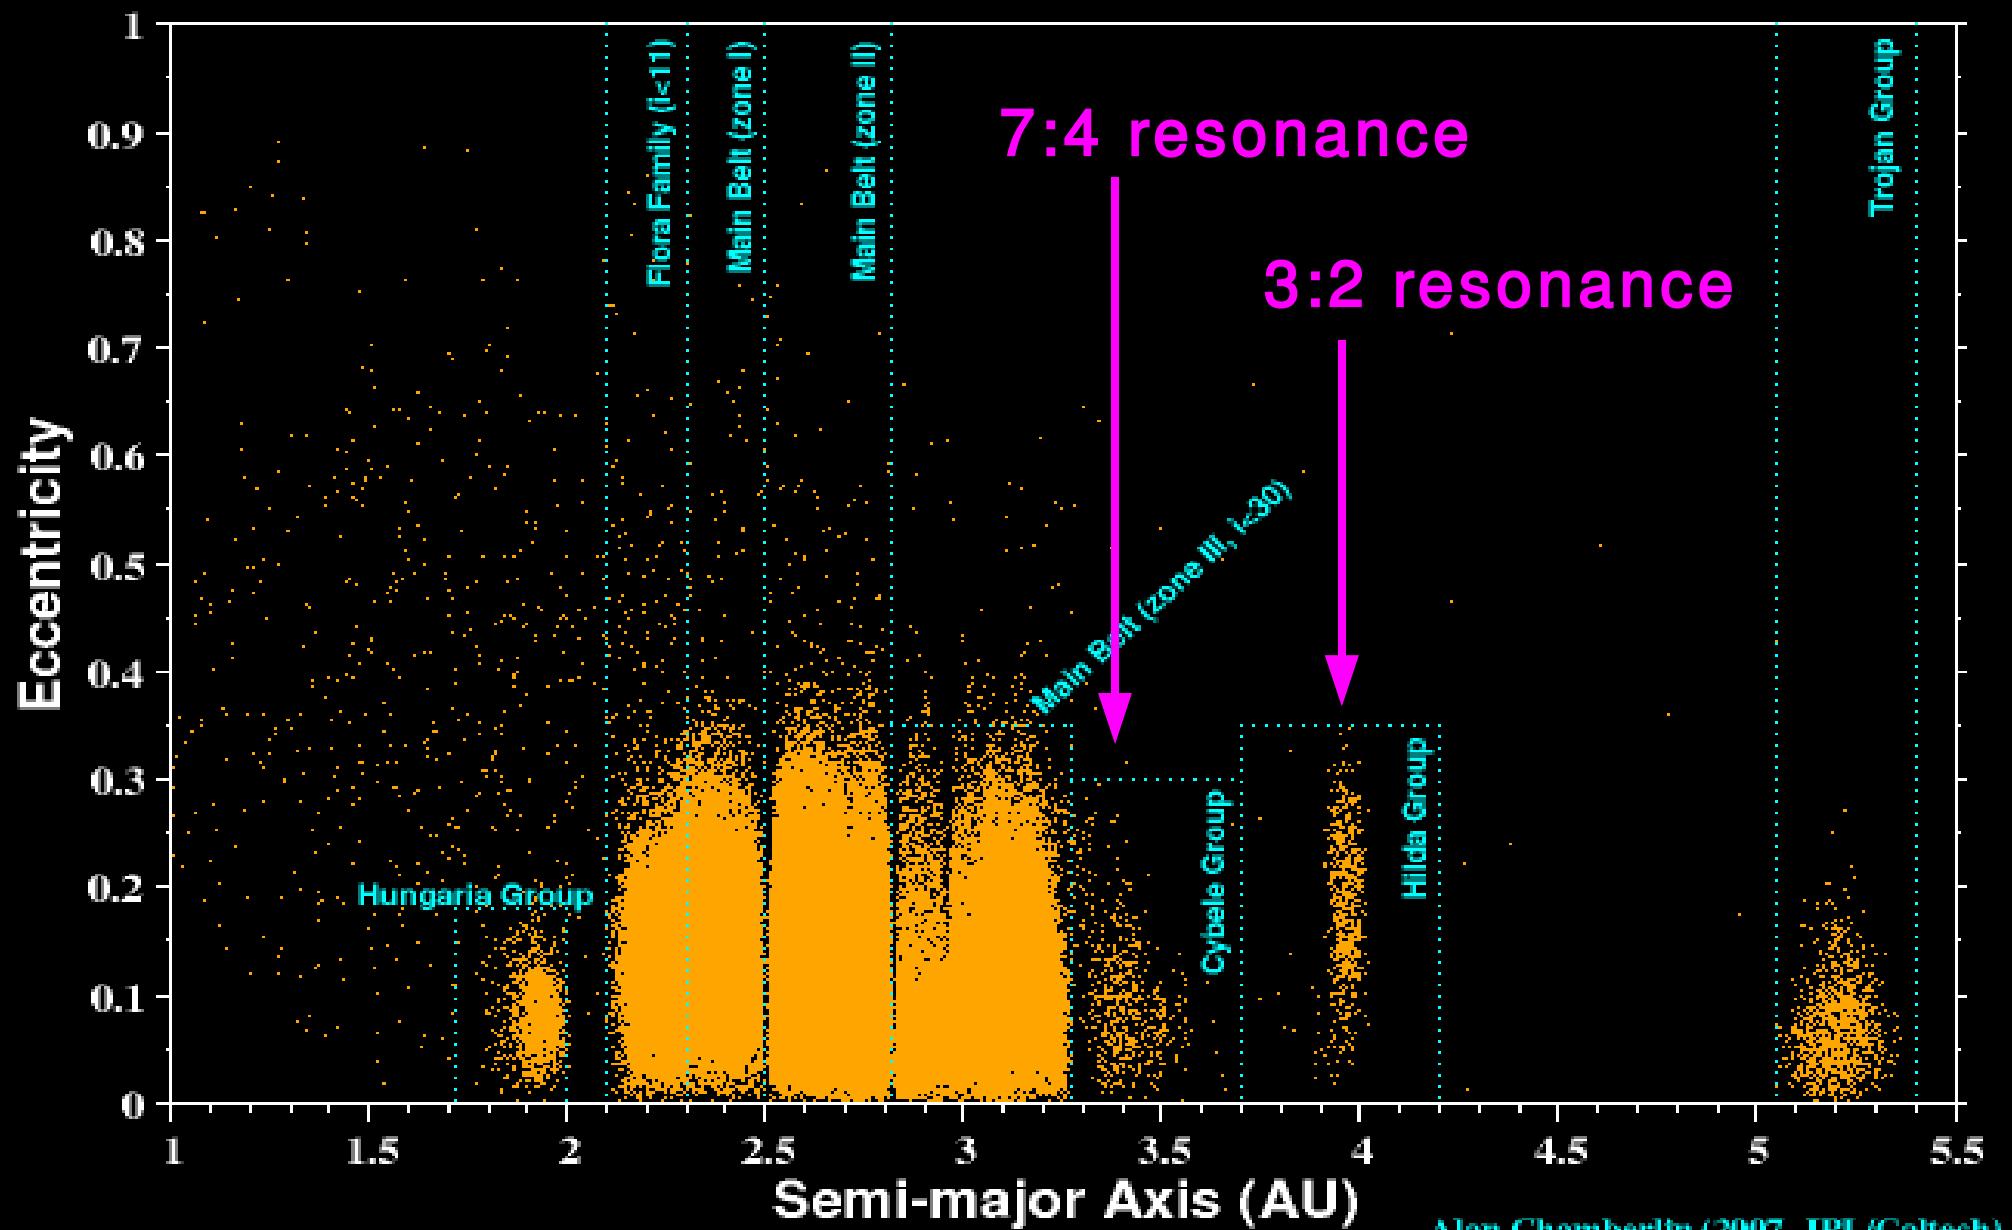

What accuracy do we need?

Geert Barentsen, gba@arm.ac.uk

IMC Croatia 2009

Asteroid Orbital Element Distribution

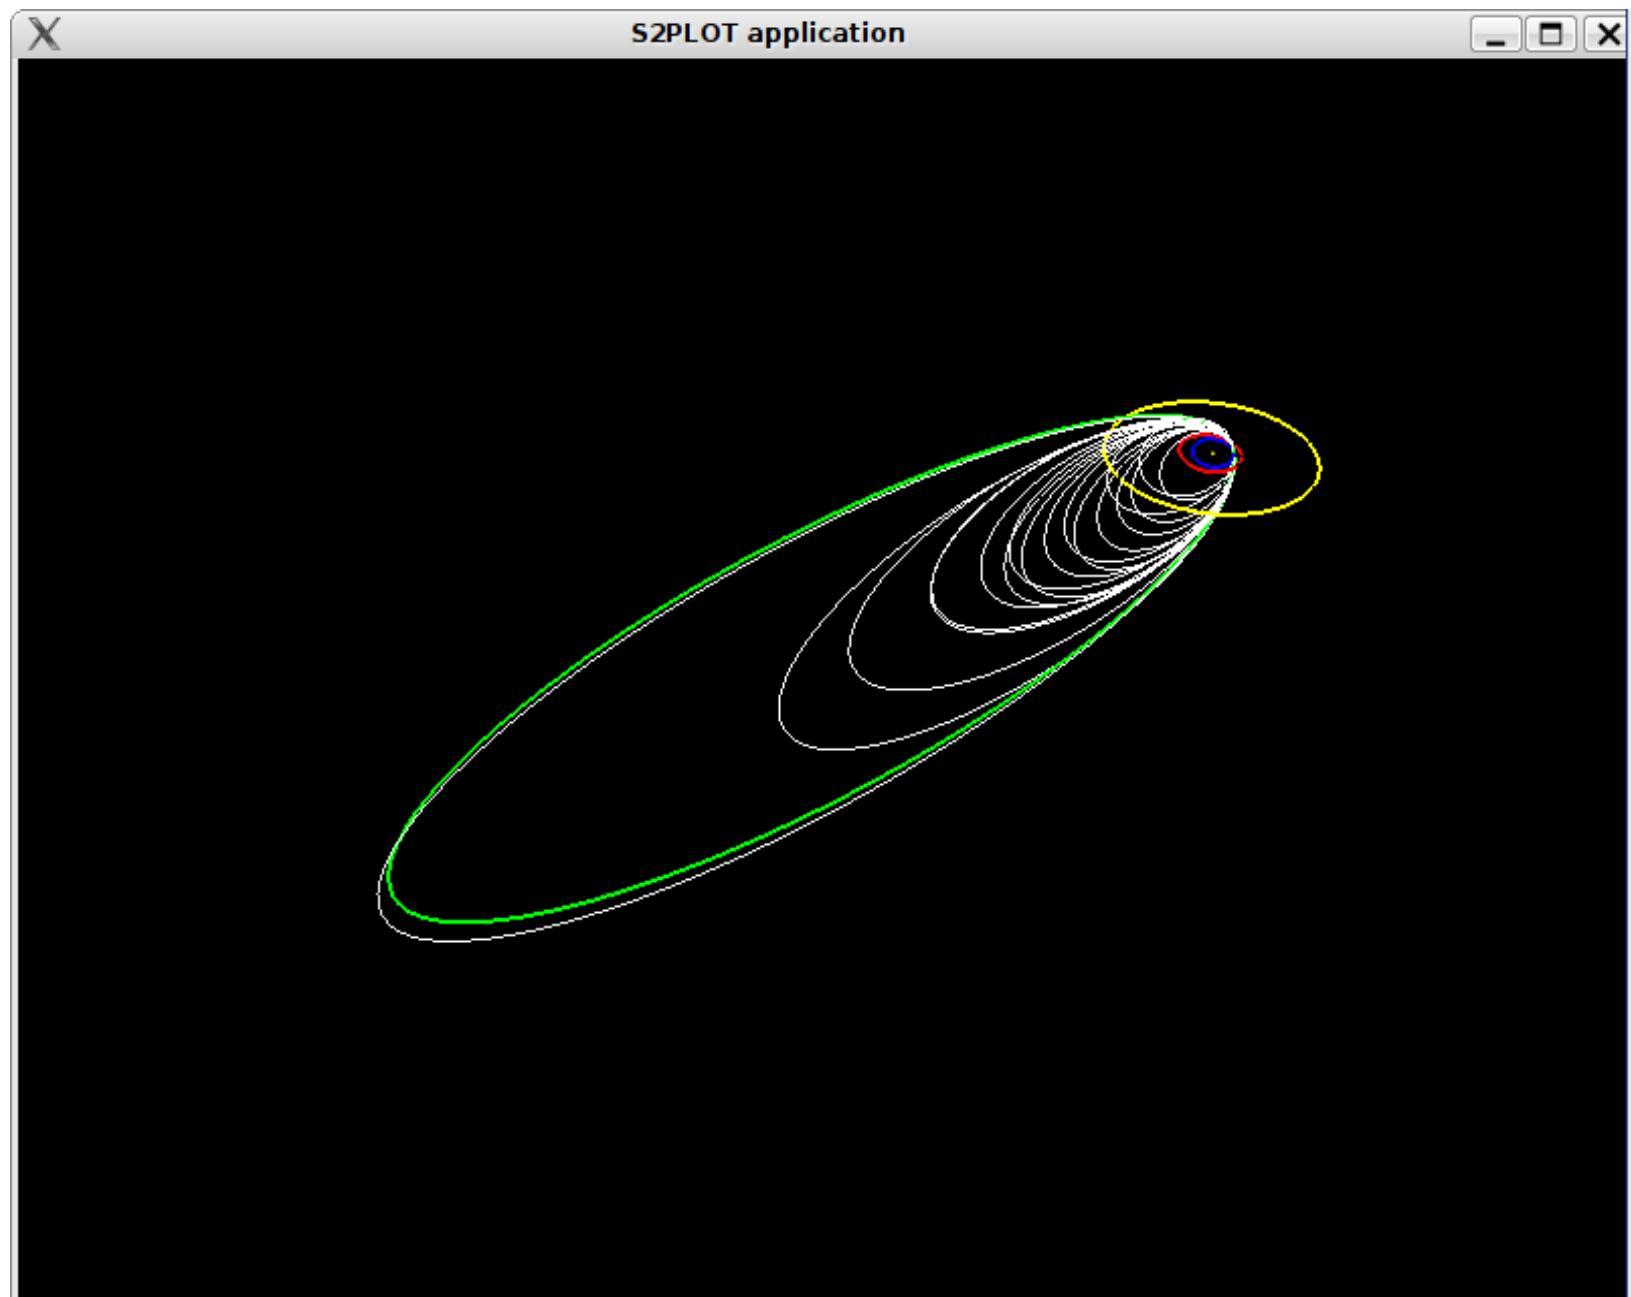

Inner Solar System

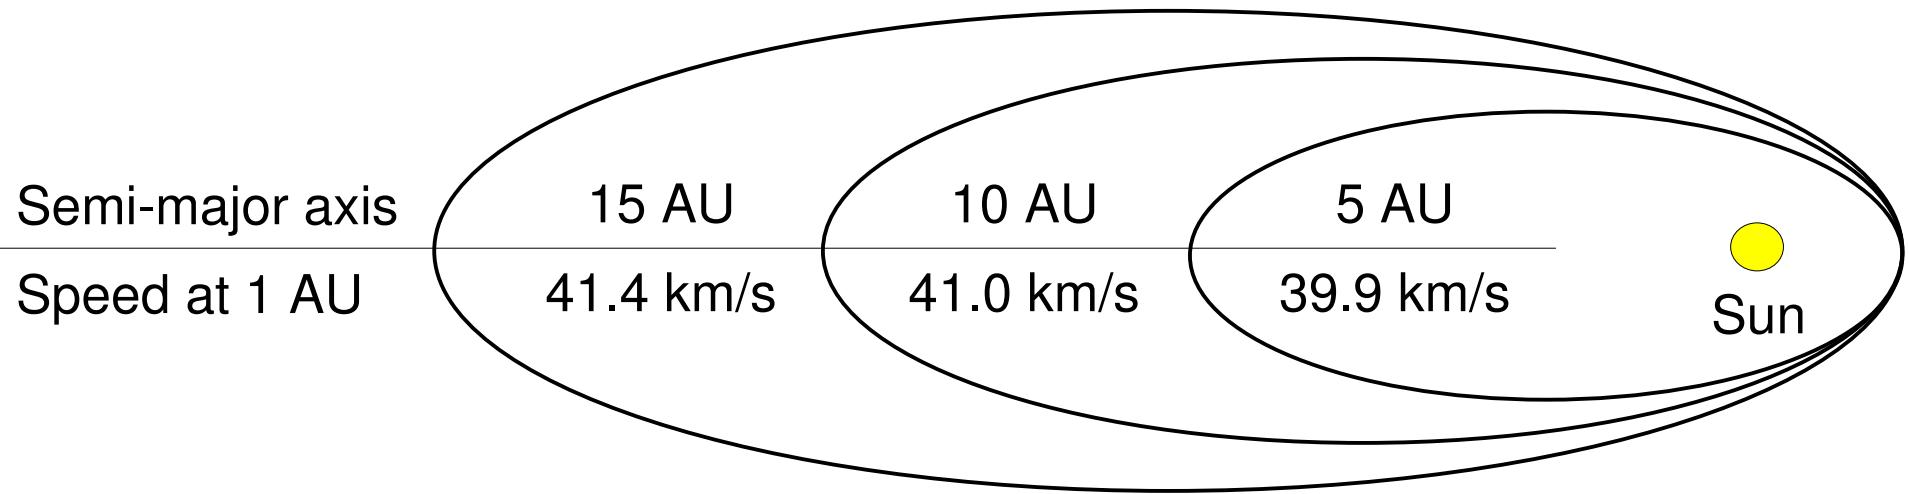

Alan Chamberlin (2007, JPL/Caltech)

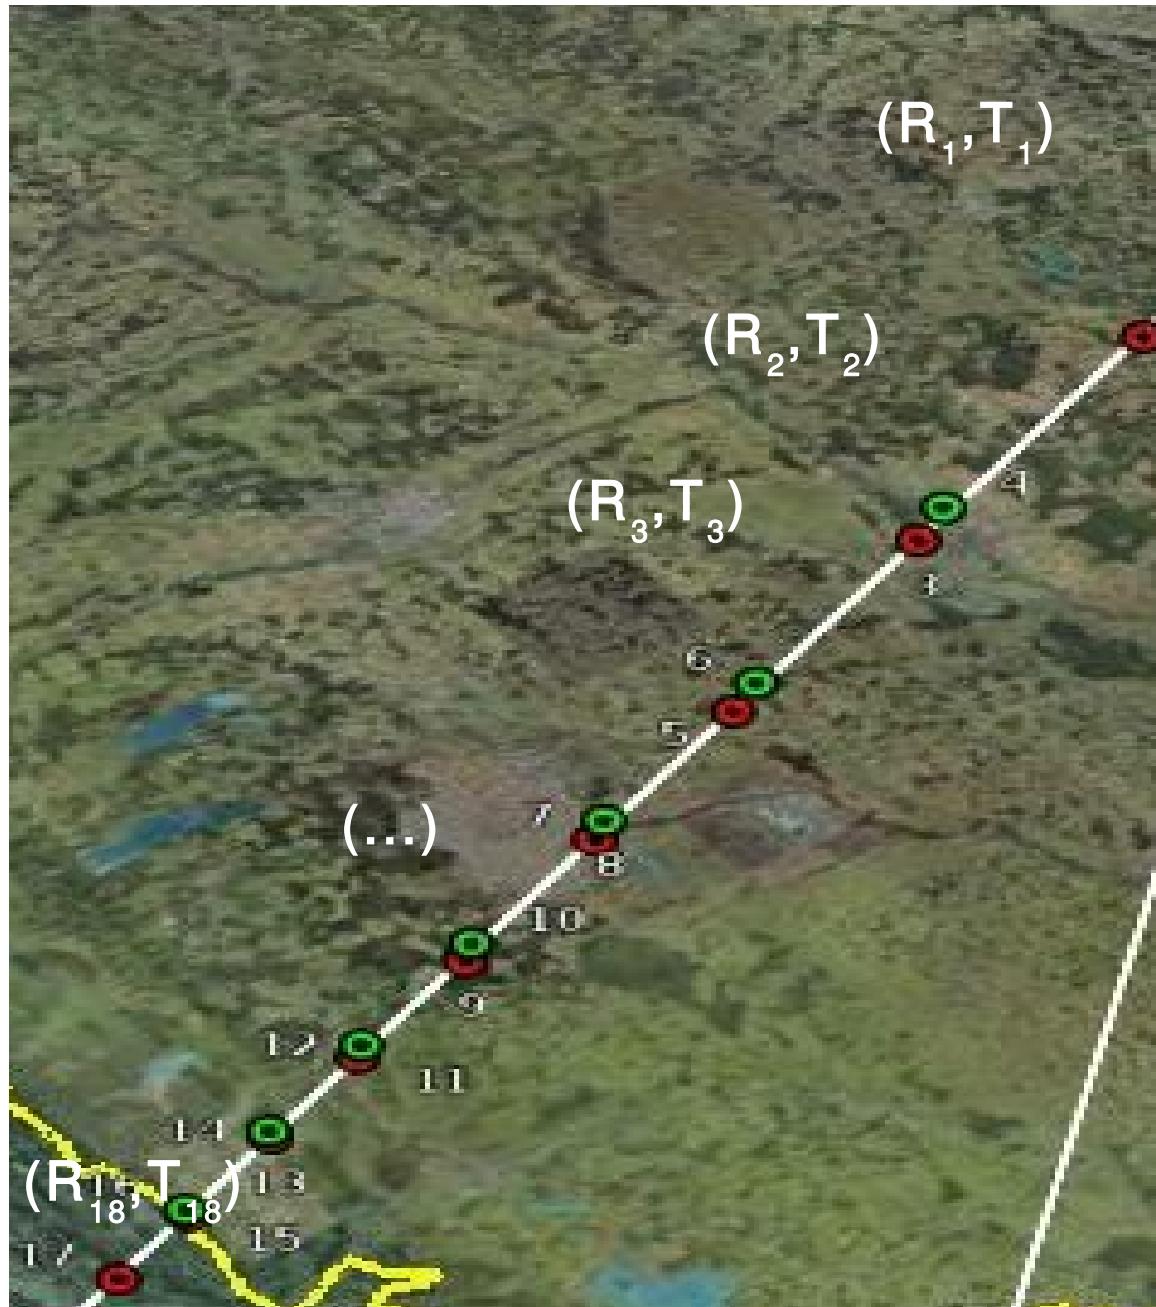

→ Can we make such graph for a meteoroid stream?

Perseids 2007 (ESA/RSSD Campaign)

$$v = \sqrt{\mu \left(\frac{2}{r} - \frac{1}{a} \right)}$$

(R_1, T_1)

(R_2, T_2)

(R_3, T_3)

$(...)$

(R_{18}, T_{18})

$$\rightarrow |v| = (R_{18} - R_1) / (T_{18} - T_1) \\ = 59.3 \text{ km/s}$$

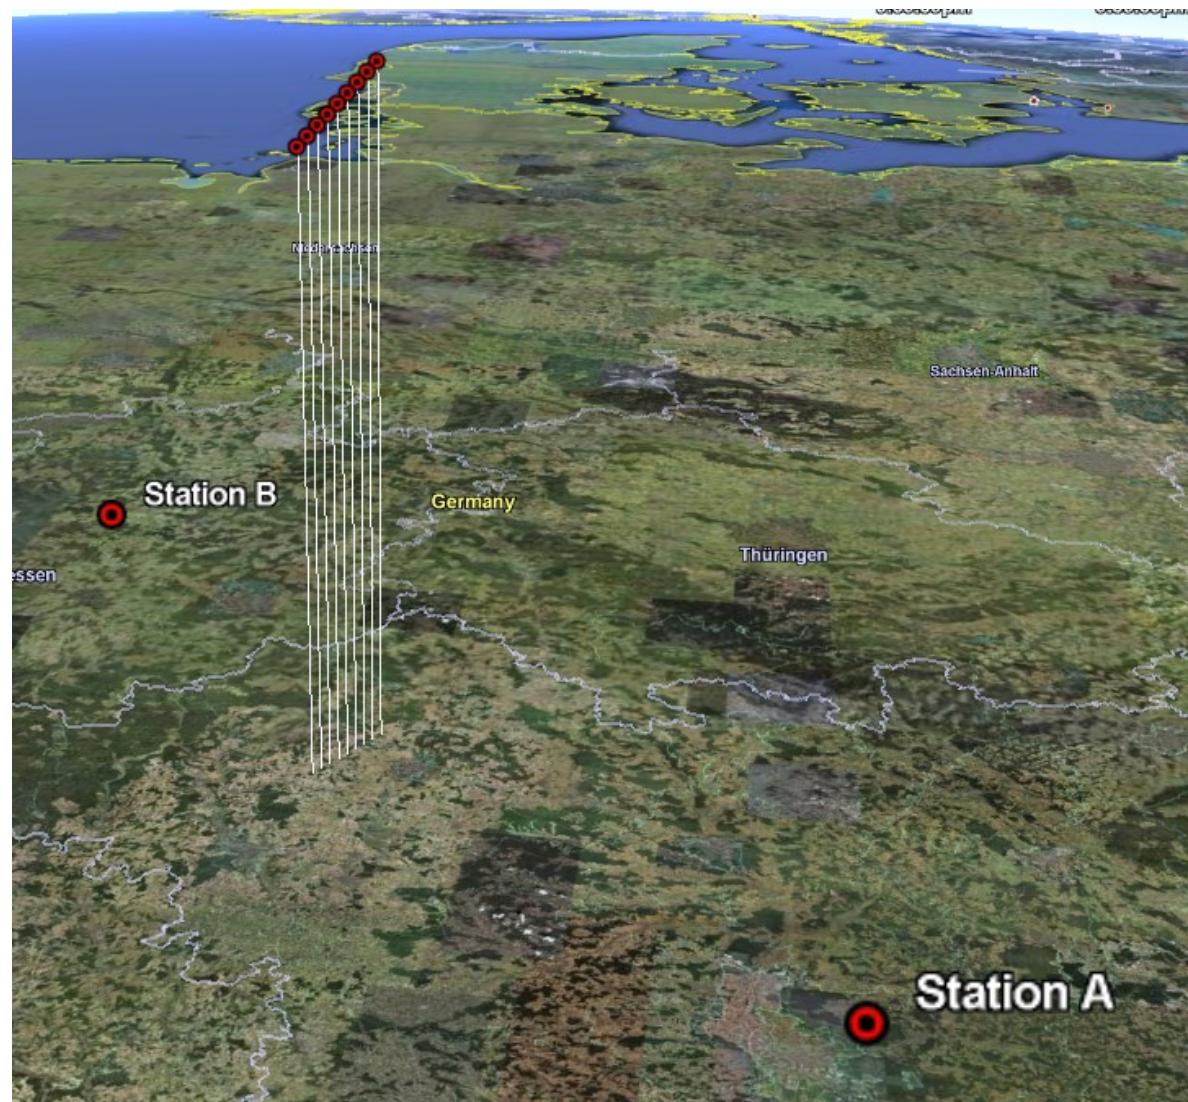

$$\rightarrow |v| = (R_{16} - R_3) / (T_{16} - T_3) \\ = 58.7 \text{ km/s}$$

$$\rightarrow |v| = (R_{13} - R_6) / (T_{13} - T_6) \\ = 61.2 \text{ km/s}$$

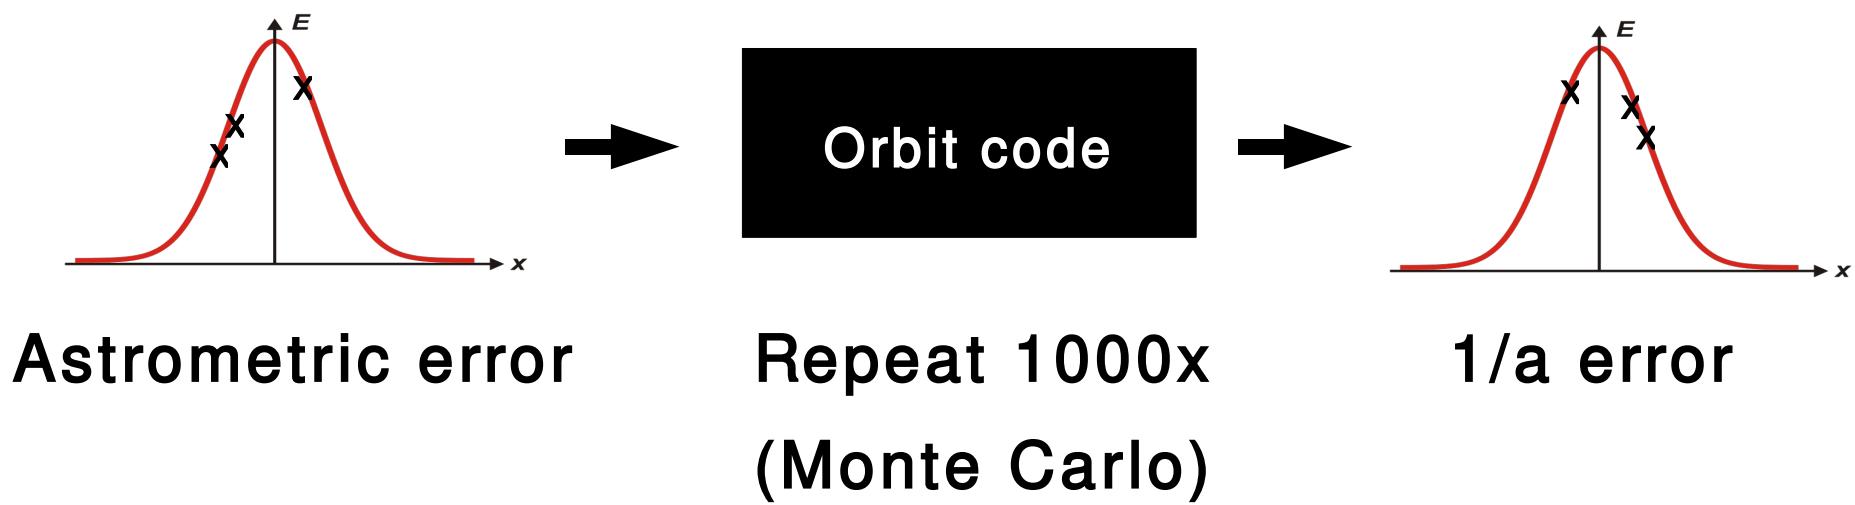

$$\rightarrow |v| = \text{avg } (R_a - R_b) / (T_a - T_b) \\ = 59.4 \text{ km/s}$$

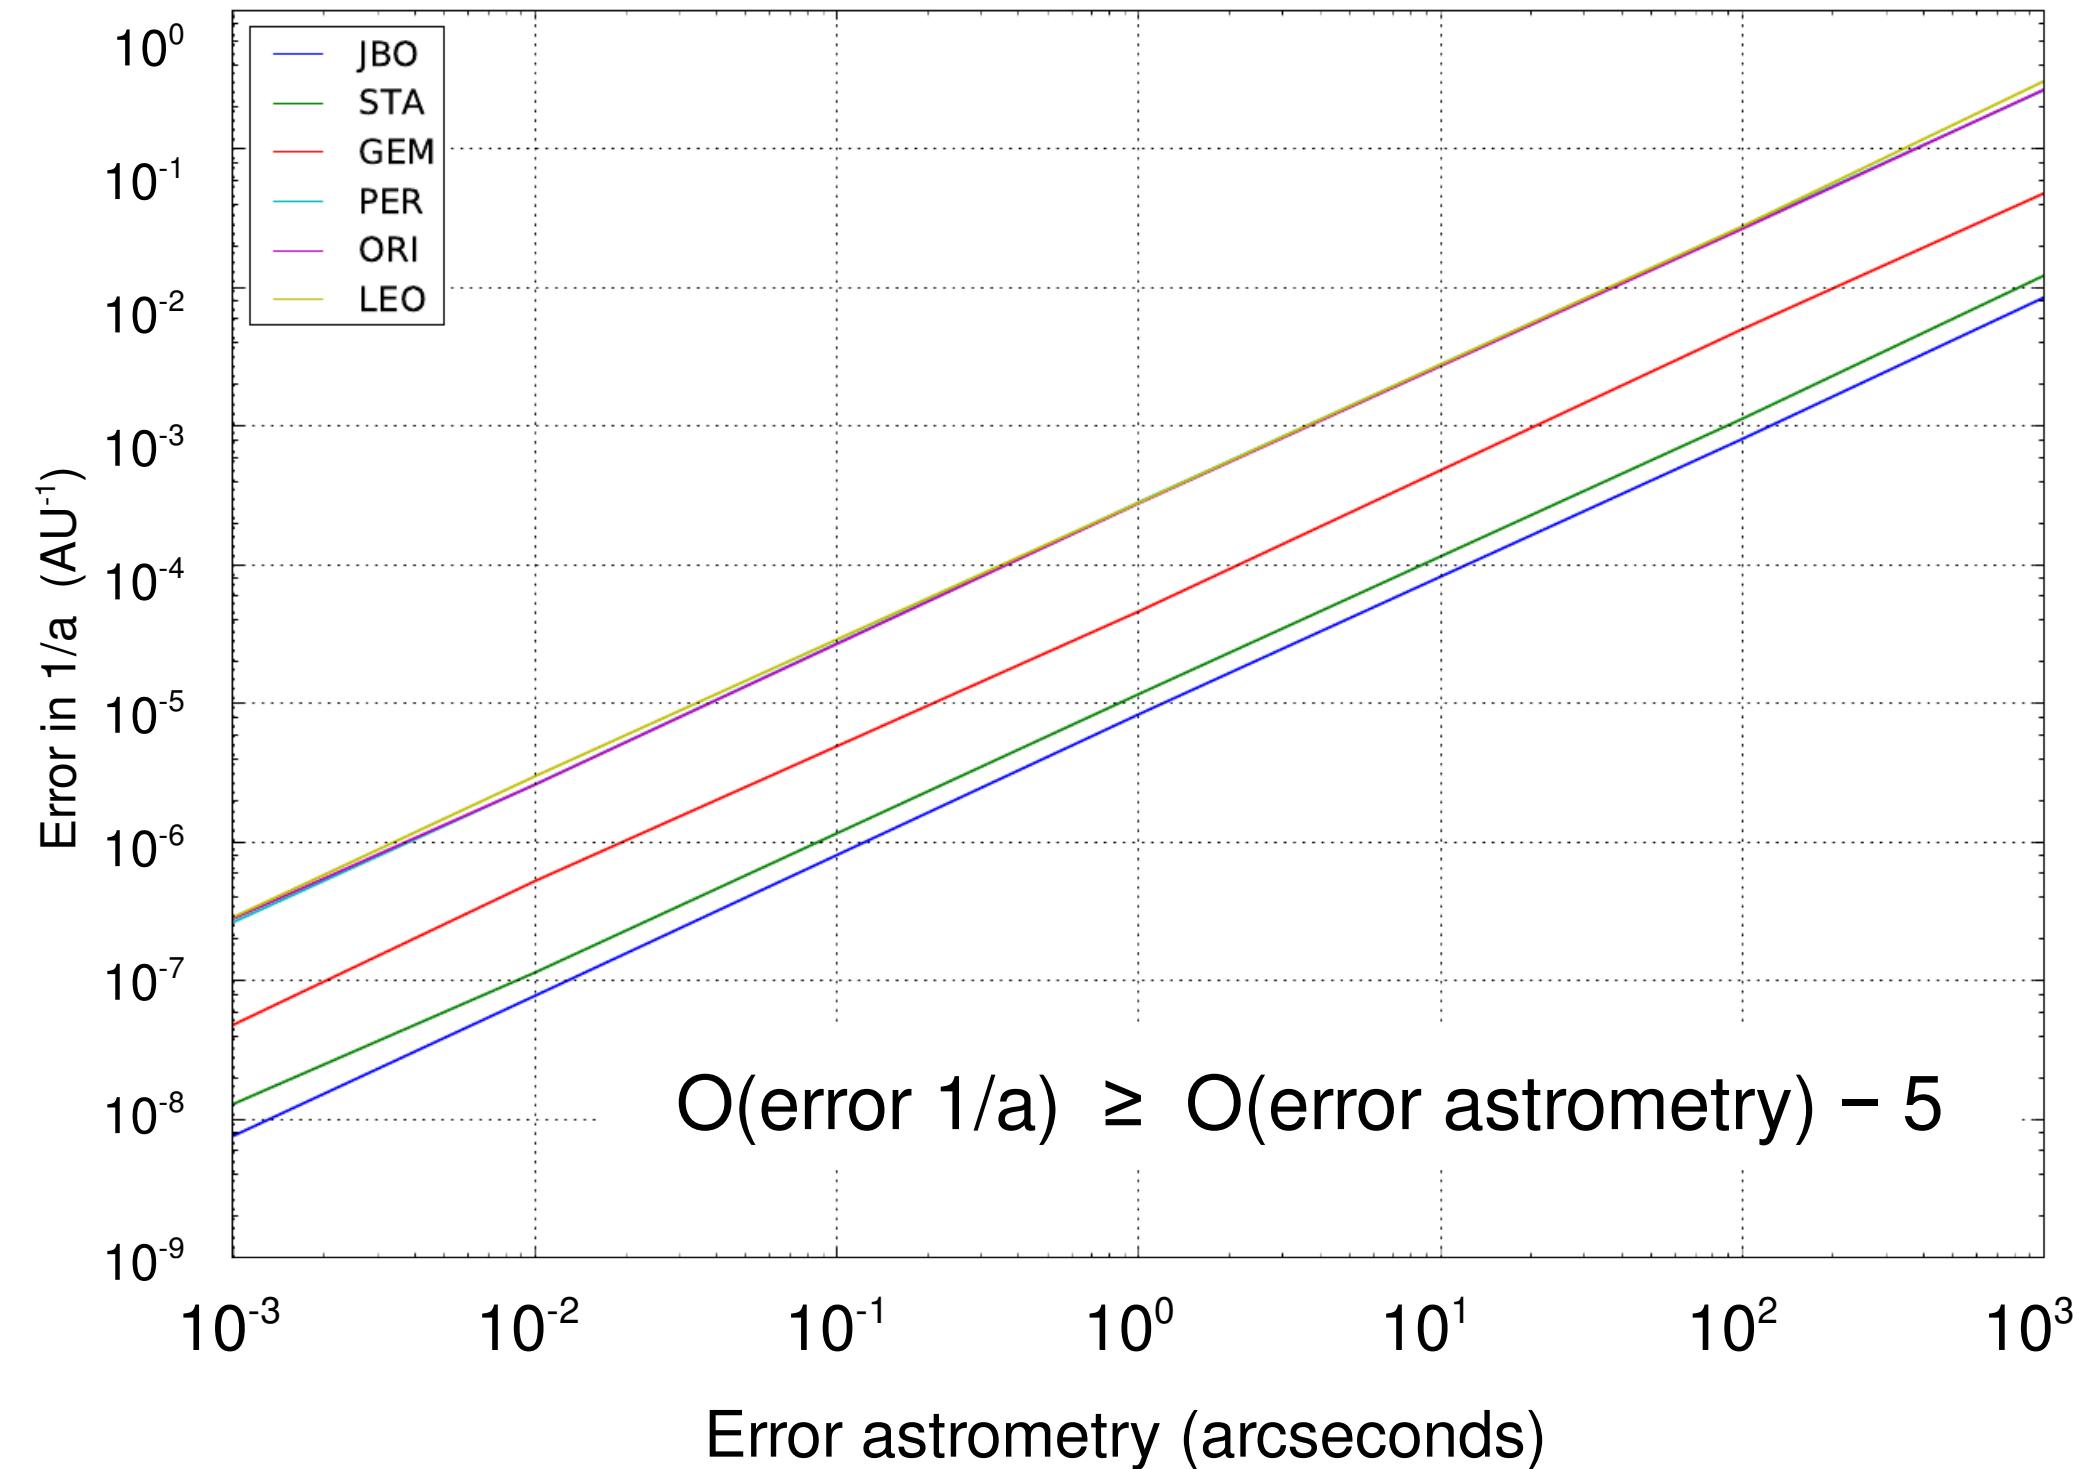

Fakeor simulations

- Fakeor = **Fake meteor**
- Input
 - Radiant (ra, dec, velocity)
 - Time + coordinates (100km)
- Output
 - Optimized observing stations
 - Astrometry from each station
- No need to go out in the cold :-)

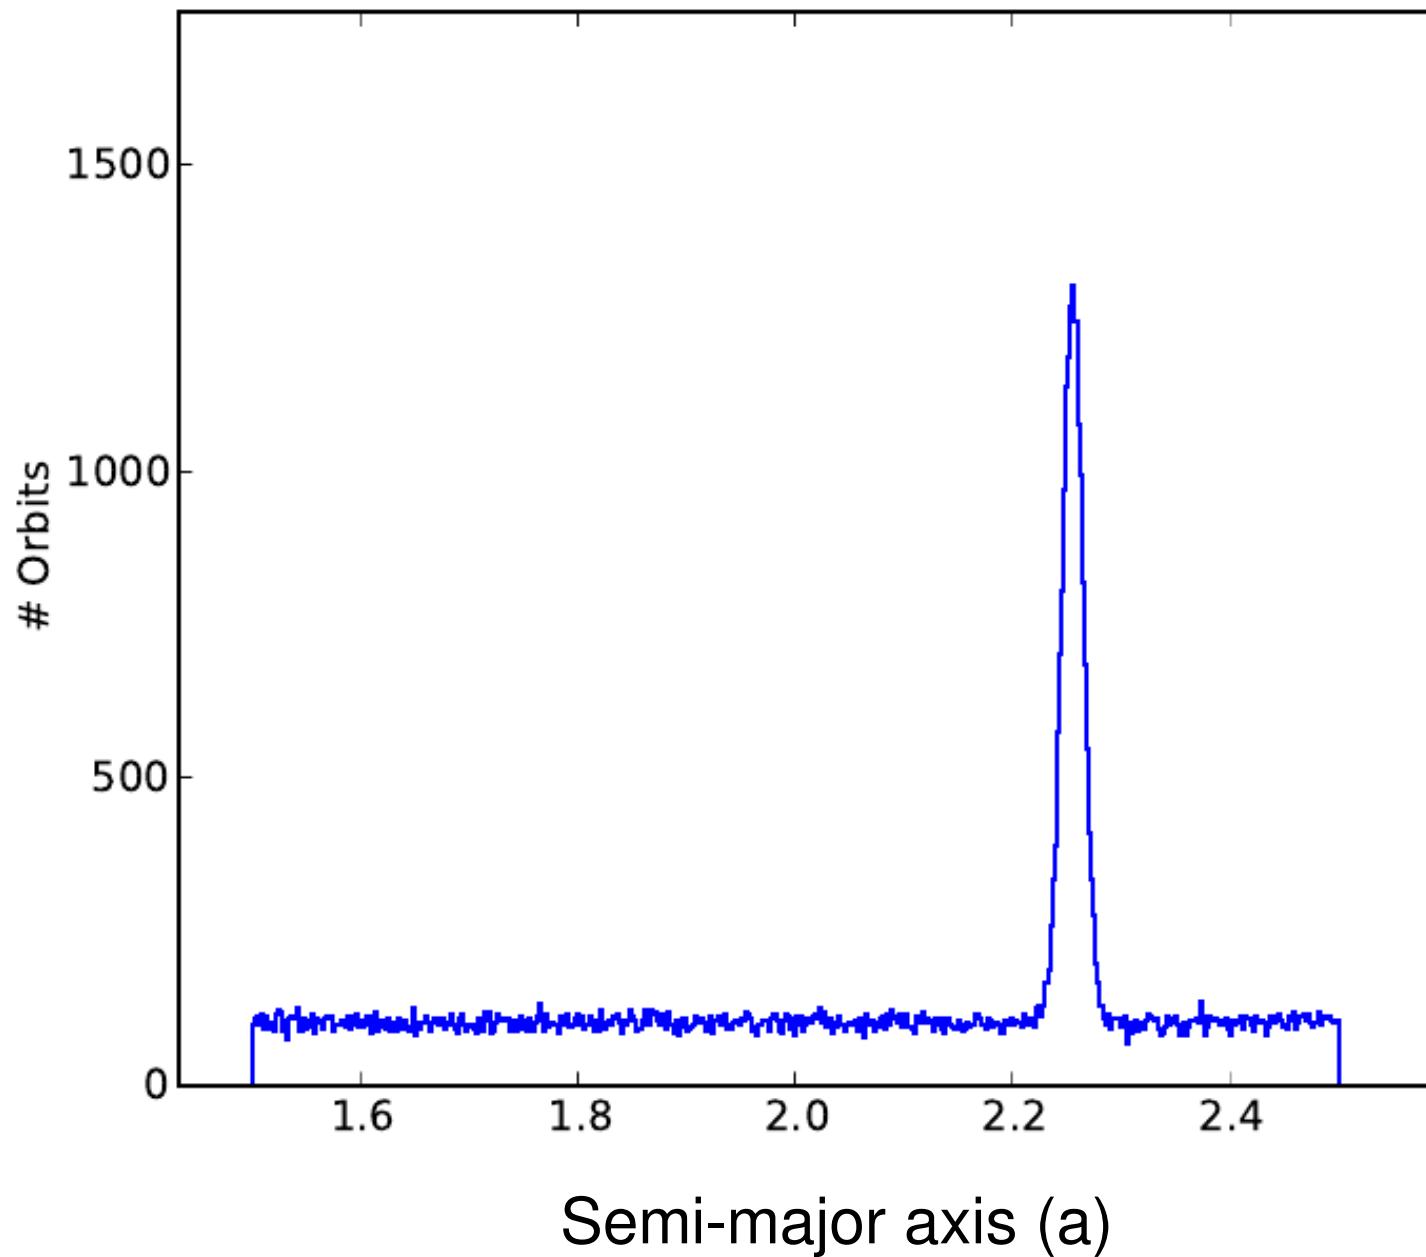

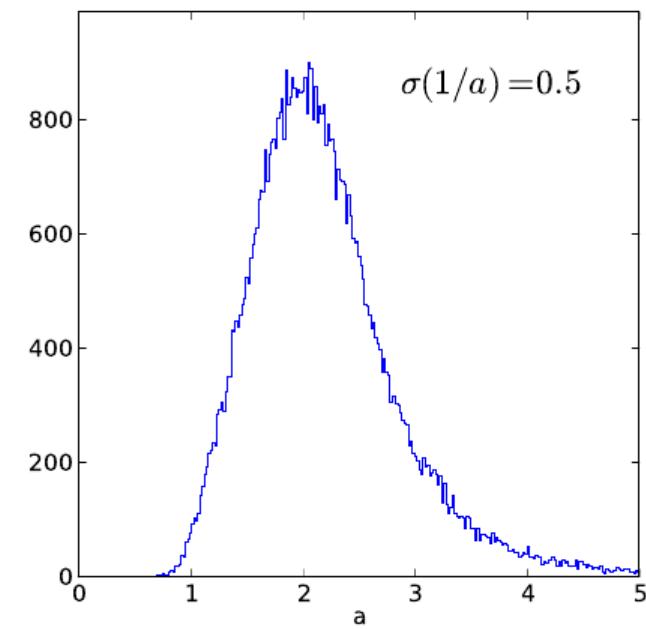

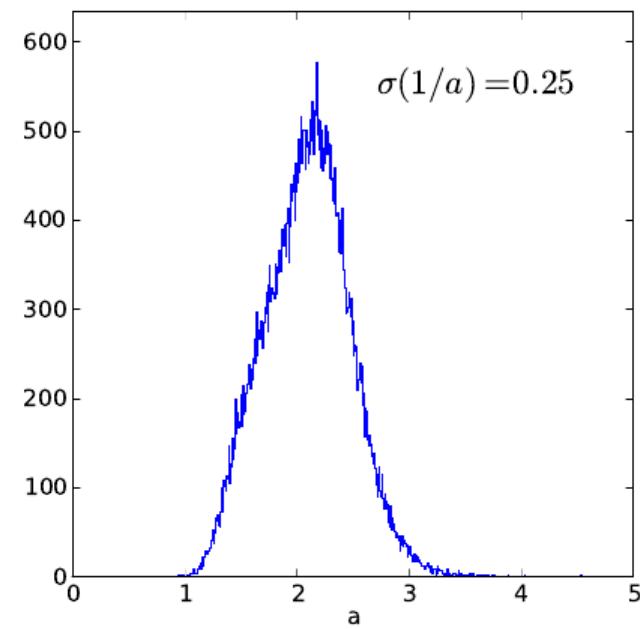

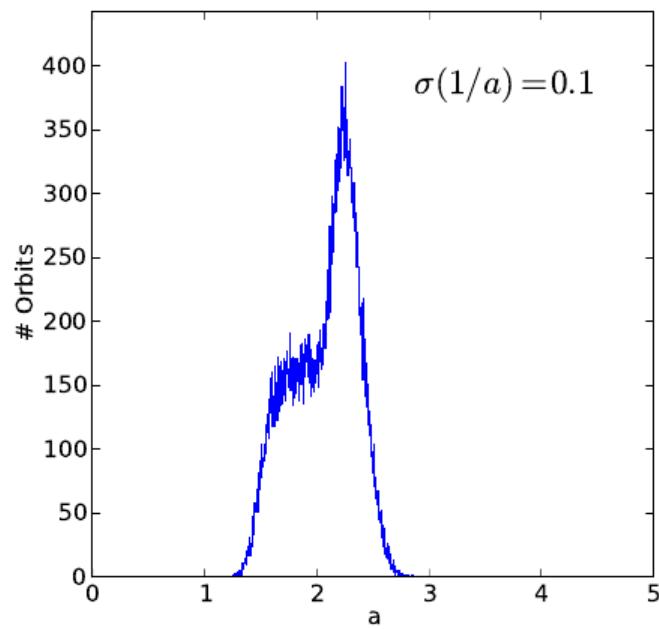

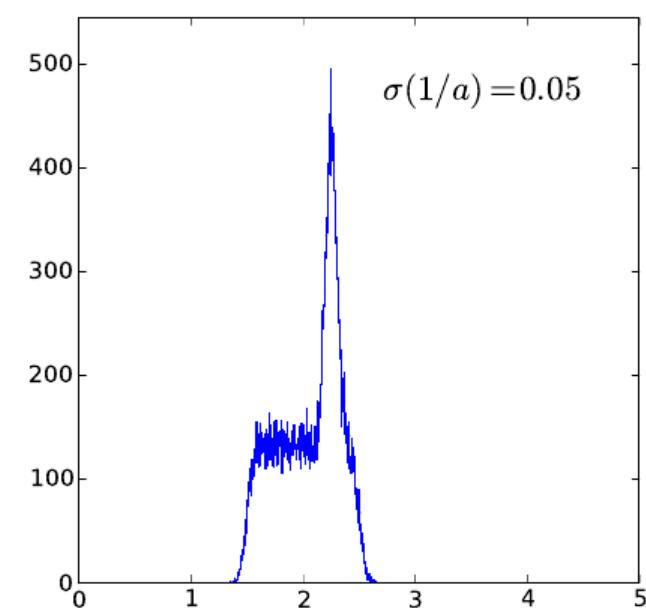

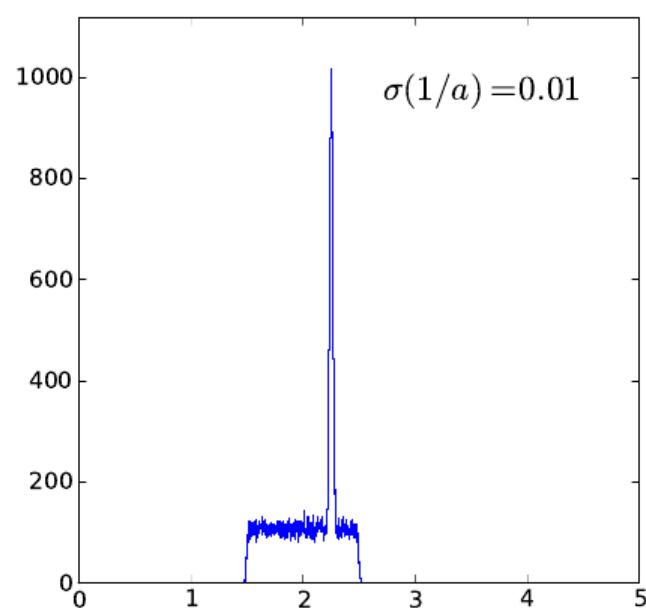

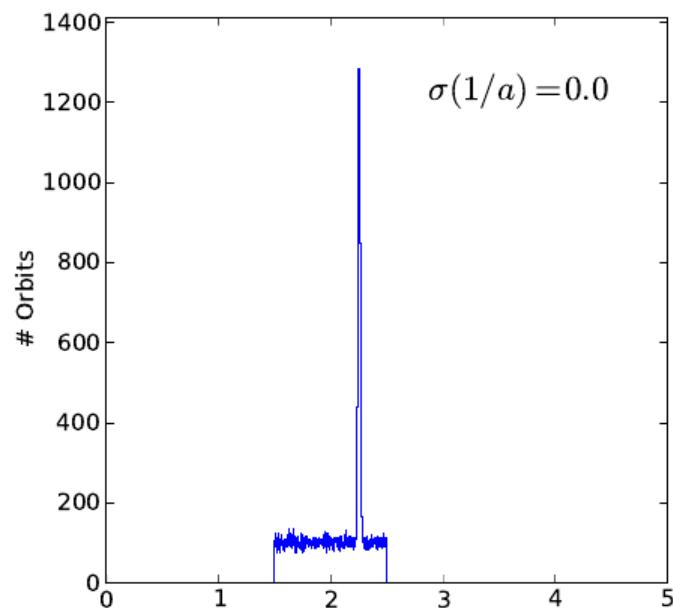

Uncertainty propagation

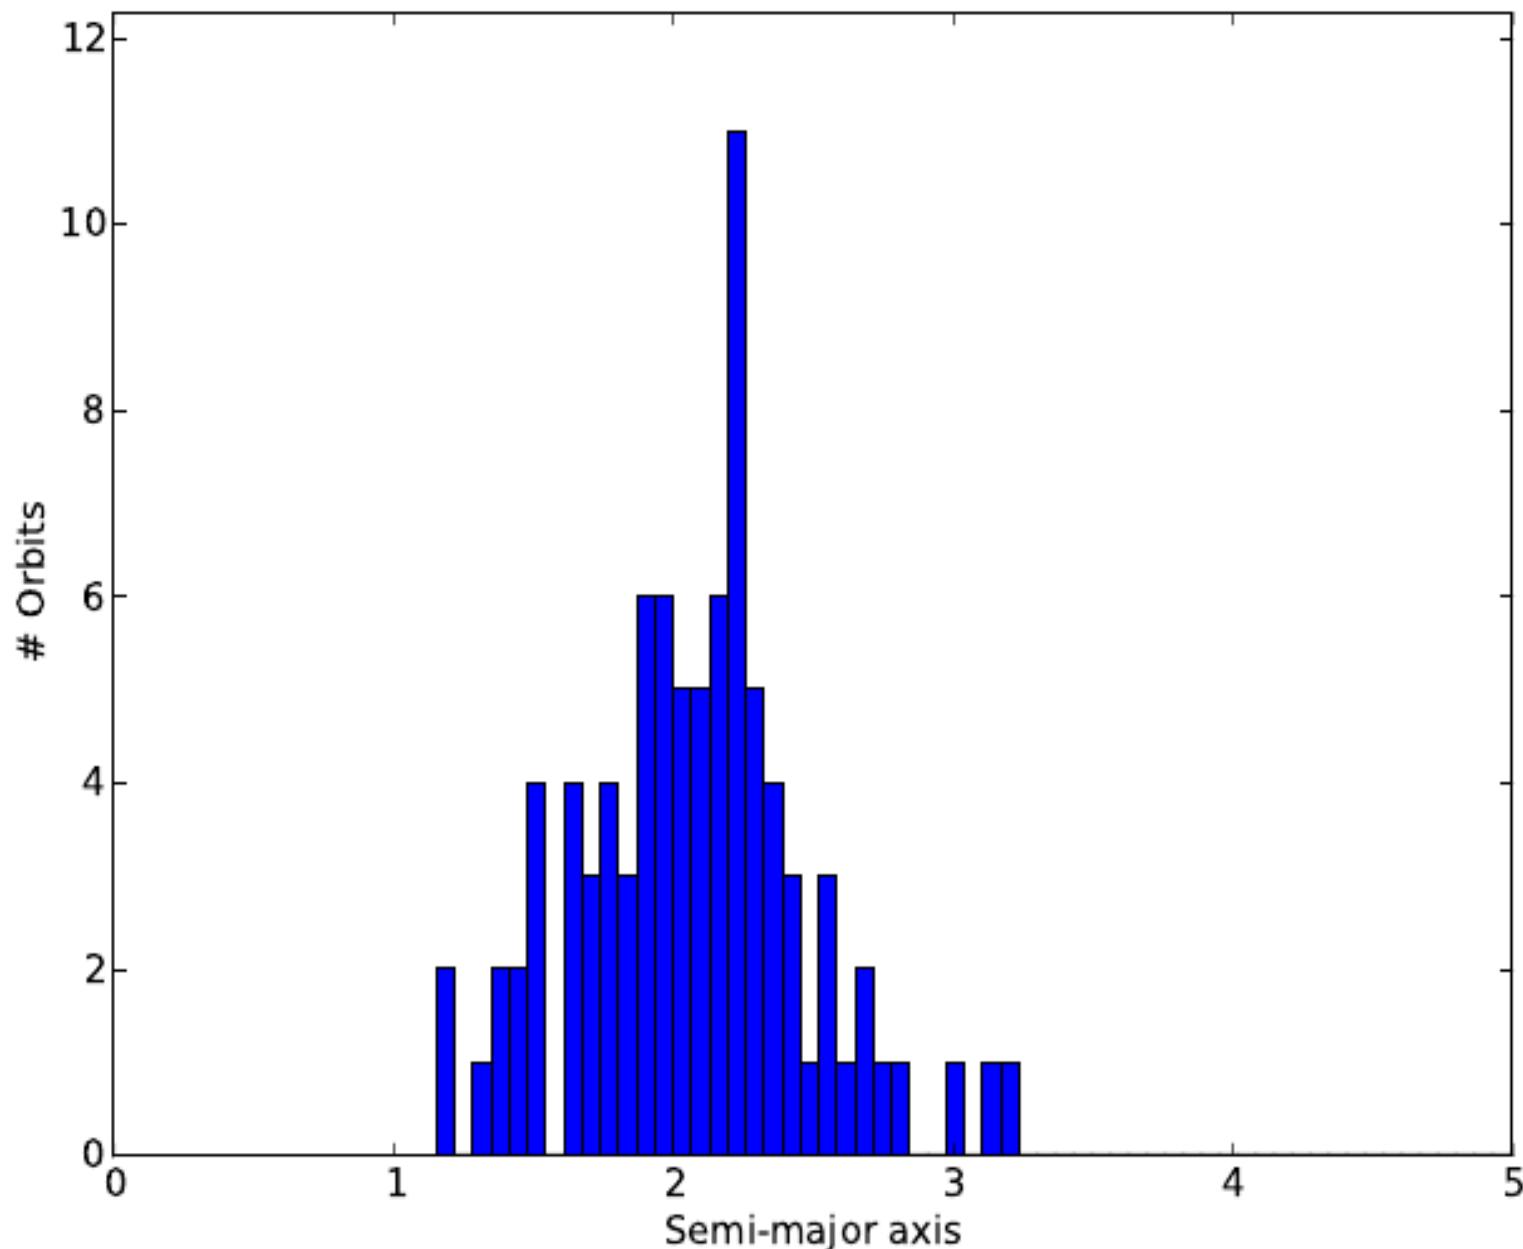

Taurids 7:2 resonance

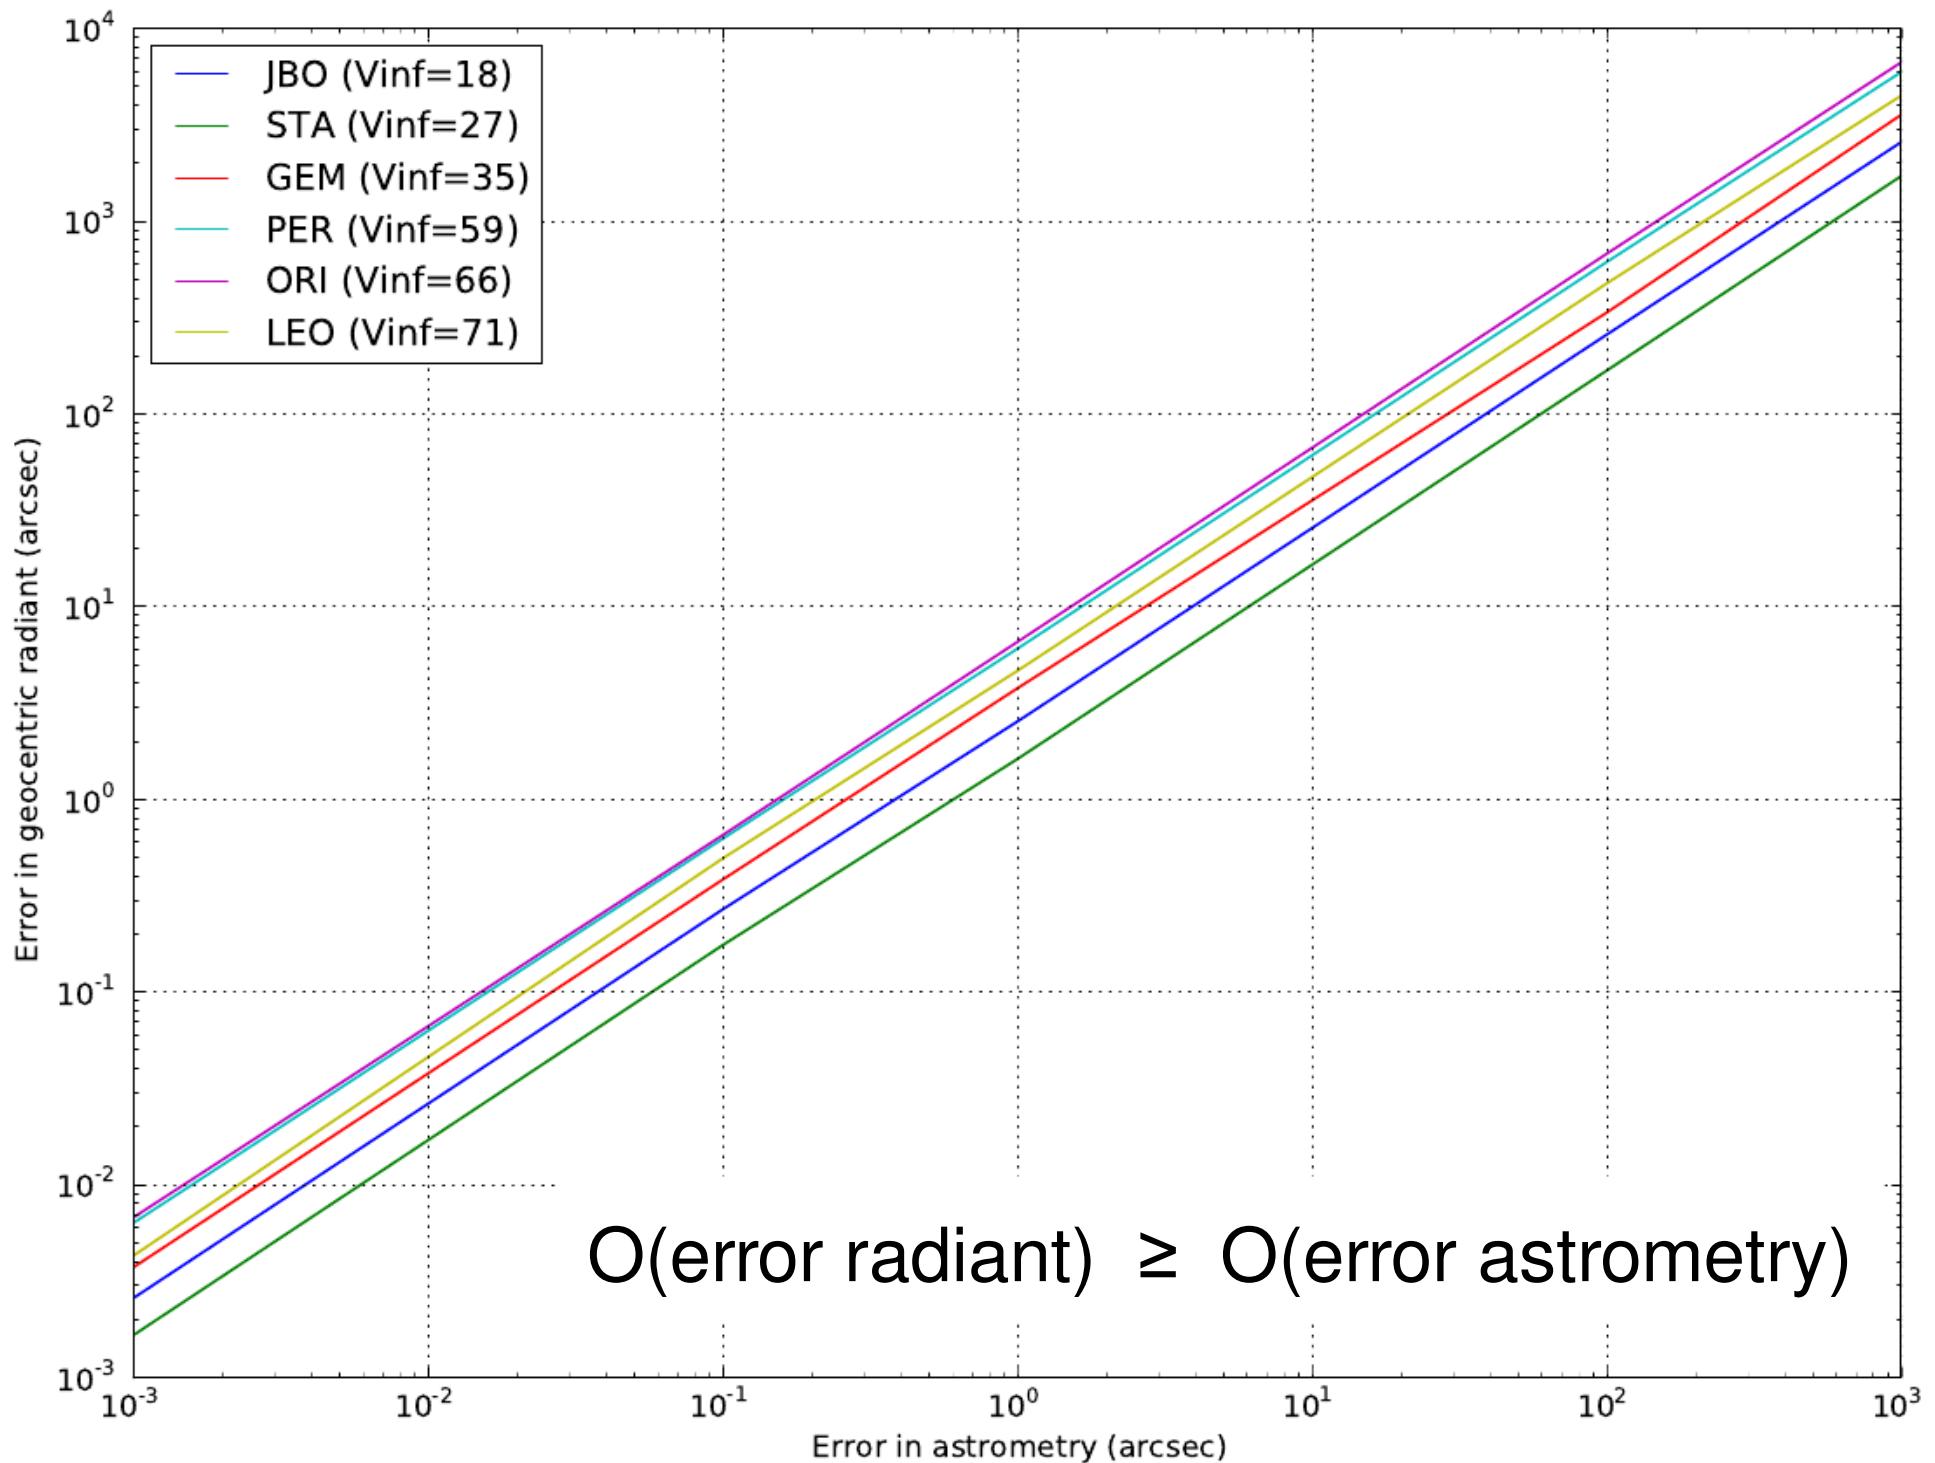

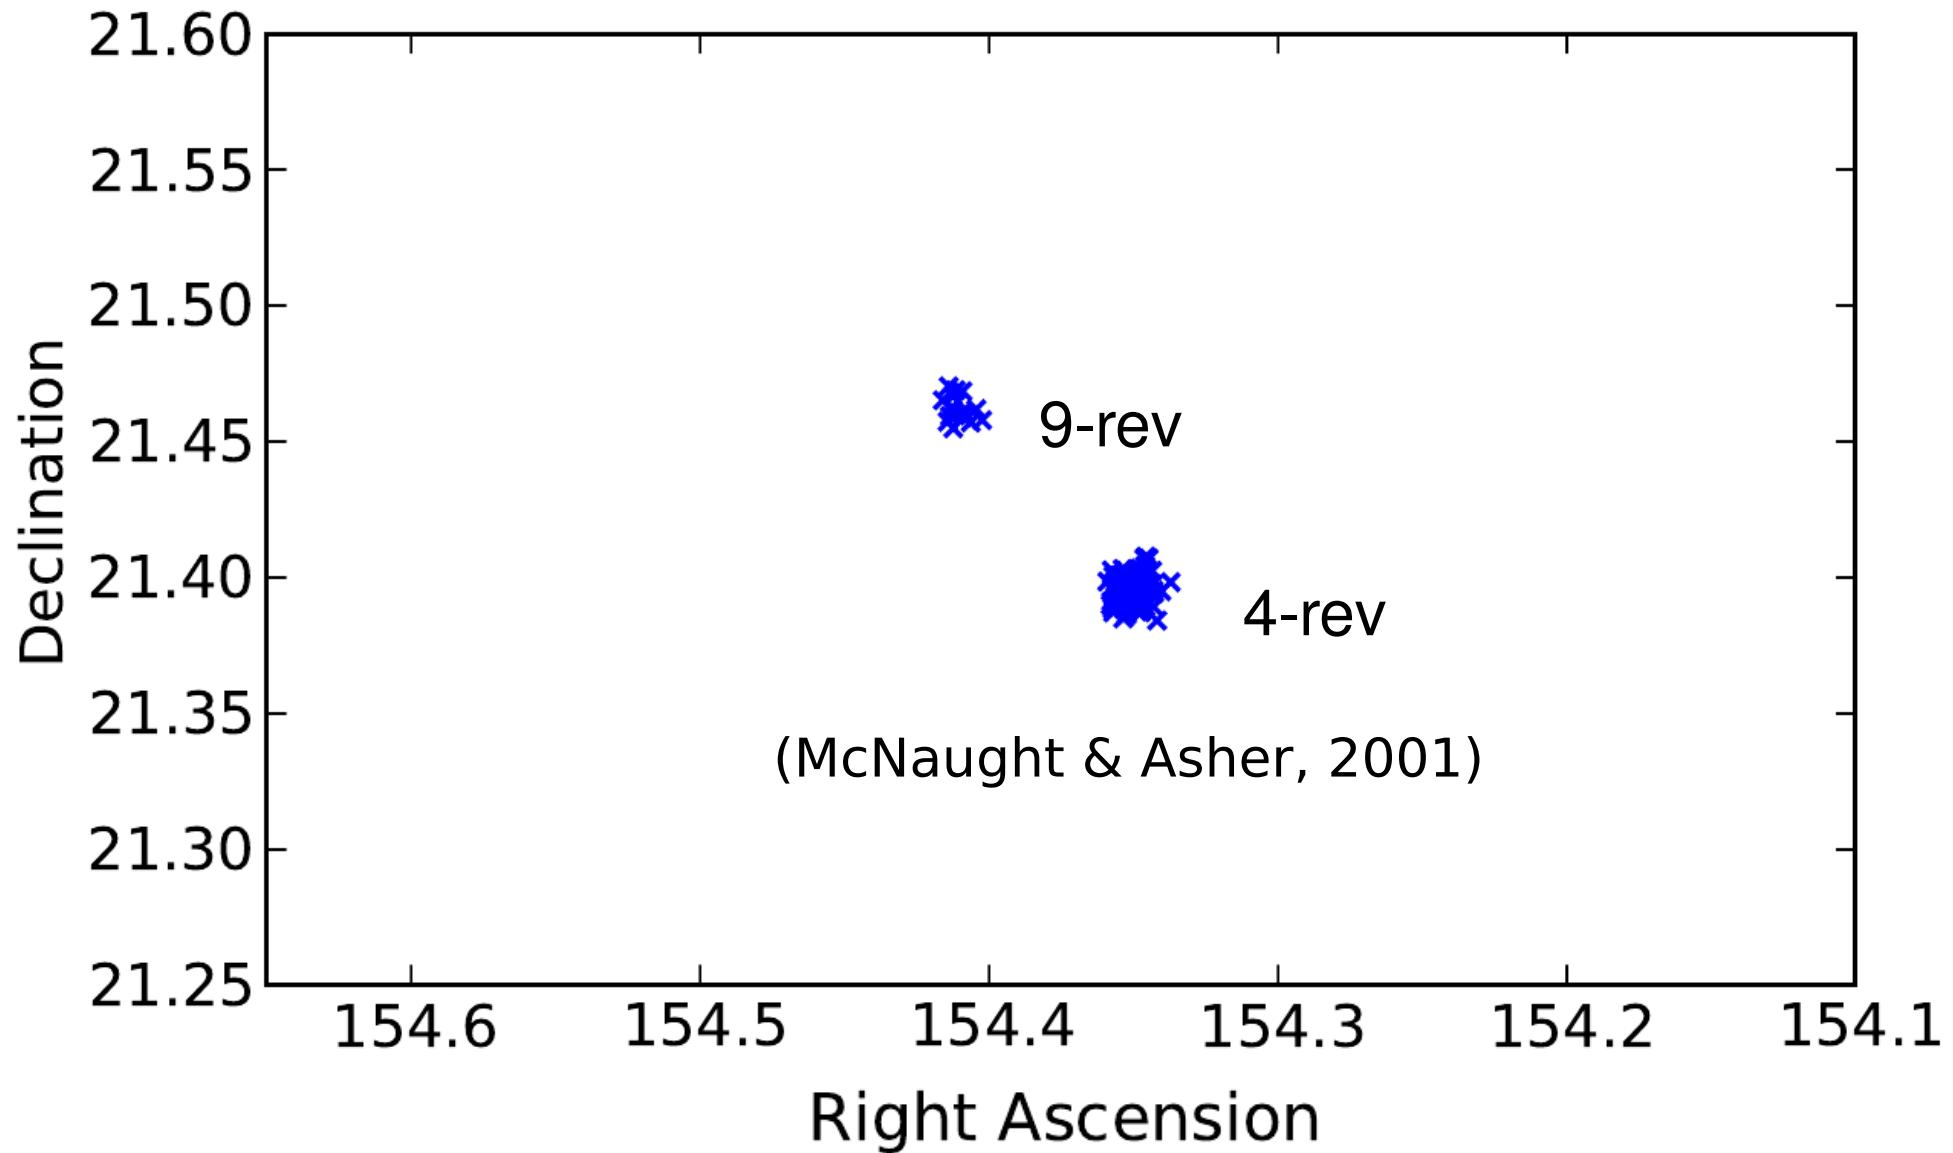

Need astrometry better than ~ 10 arcminutes

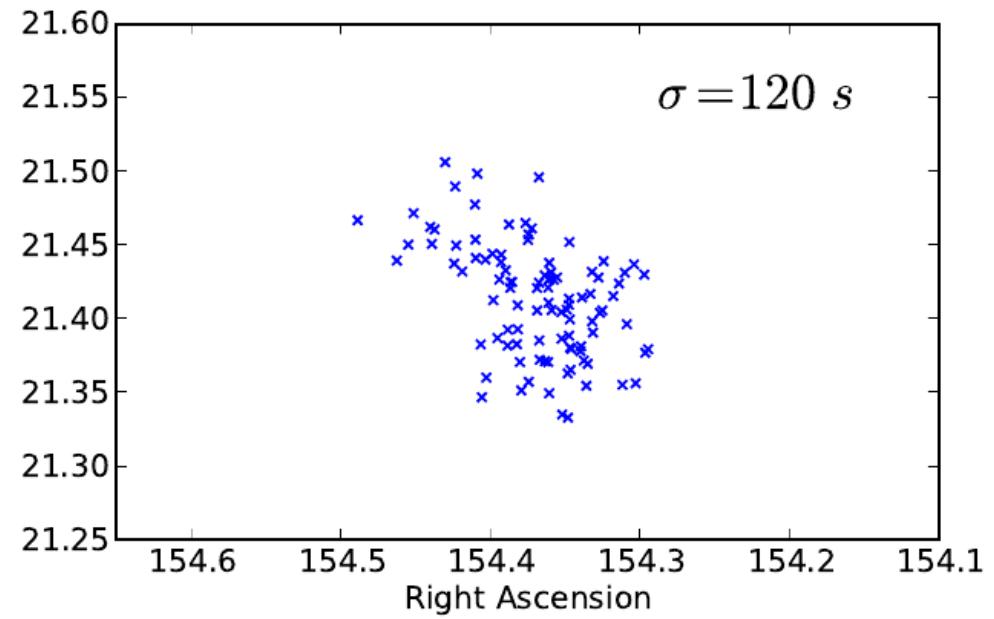

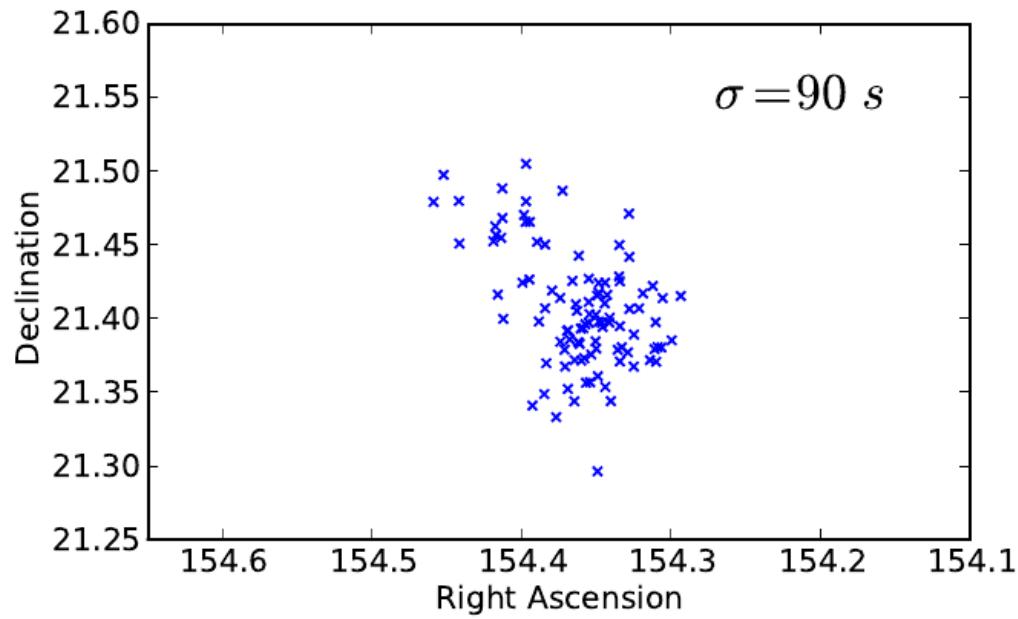

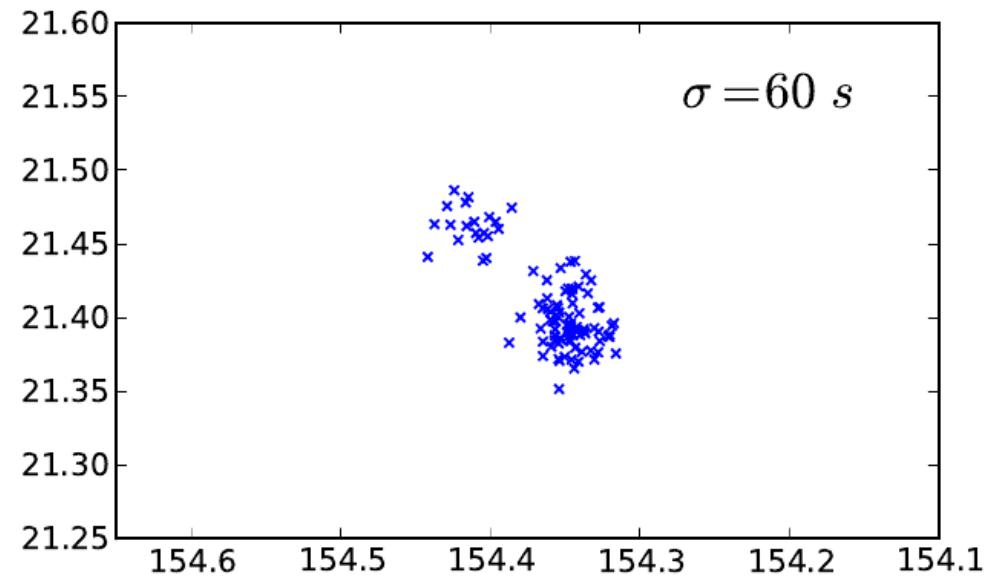

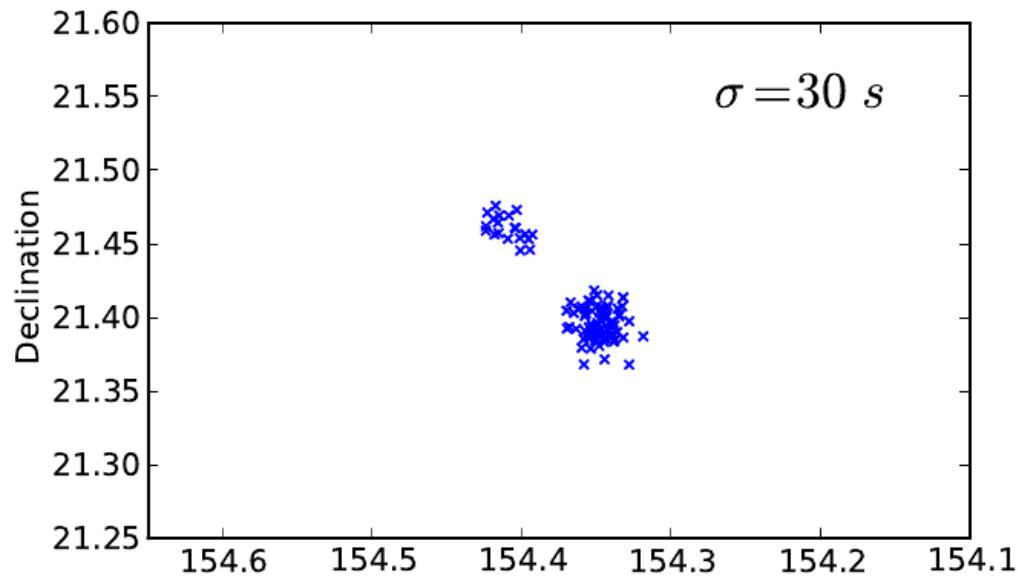

Taurids in the IAU Orbit database

Leonids 2001

Need astrometry better than ~ 1 arcminute

My message today

- To observers

1-10 arcminute accuracy is the upper limit required to uncover the substructure of a meteoroid stream

- Your system may have a different goal
- Understand your errors!

- To modelers

Specify your needs in terms of observables
