# Motivation for video meteor network

- To have relatively precise orbits  
-> theoretical invest. of meteoroids origin
- To have statistically sufficient meteors to distinguish weak showers  
-> possible asteroidal origin  
*(Tóth, Vereš and Kornoš, 2011, MNRAS, 415, 1527-1533)*

# Astronomical Observatory at Modra

# Slovak Video Meteor Network

- Start: 1998-1999 first Leonids obs.
- Systematic observations from April 1, 2007 as a single station, more than 20 000 met.
- Second station 2009, several 1000 p.m.
- Cooperation with amateur stations CEMeNt by 2009

# All-sky digital video setup of fish-eye lens ...

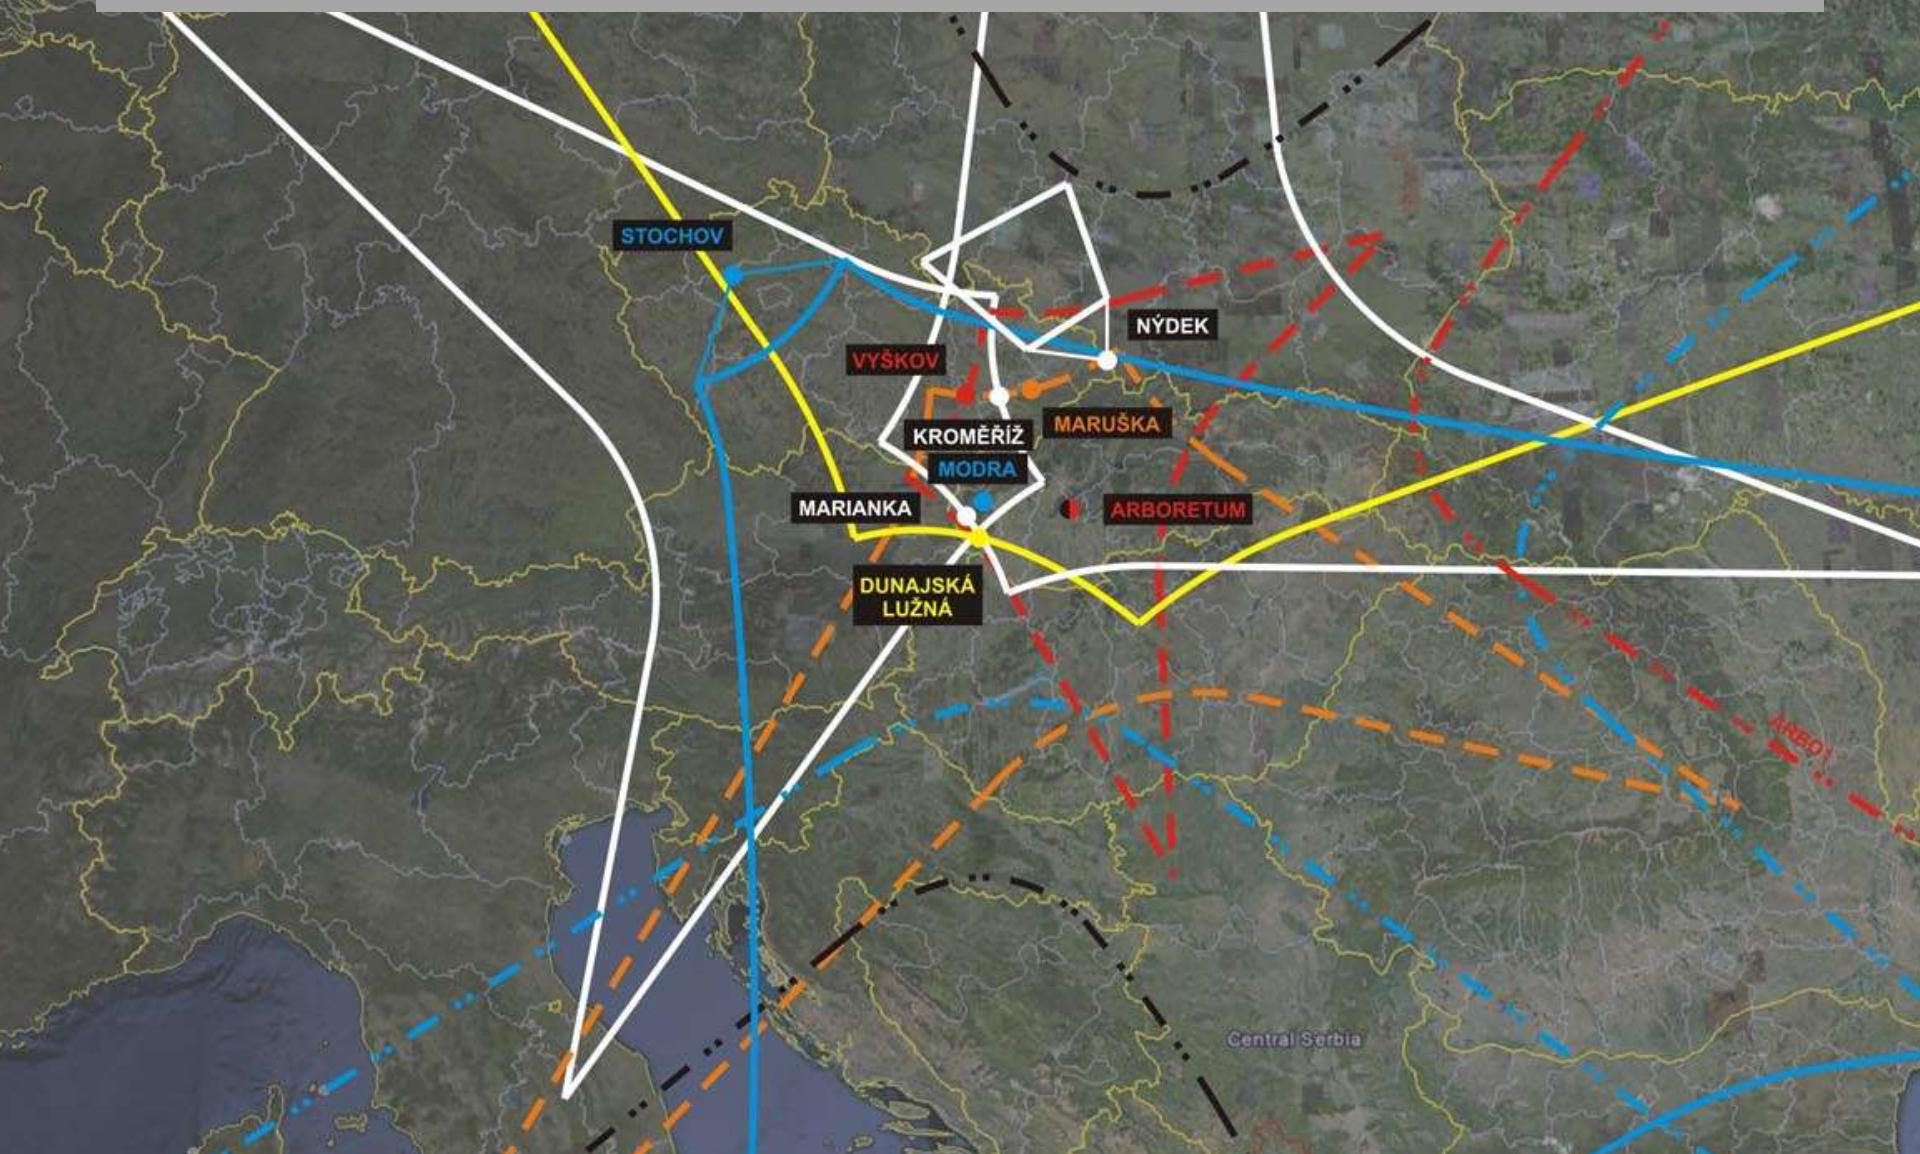

- noncompressed .avi files with moving objects are stored
- 15 frames/s
- 1280 x 960 pixels
- resolution ~ 8 arcmin/pixel
- field of view 180° x 140°
- limiting stellar magnitude ~ +5.5
- faintest meteors ~ +4.0 mag.

# Lyrids 2009

- April 21/22 from 19:15 to 2:20 UT
- There were 78 and 52 meteors detected from the first and the second station, respectively.
- 32 meteors were simultaneously observed from both stations
- 17 of them were Lyrids.
- Analog cameras Watec, first double station test

# Lyrids 2009

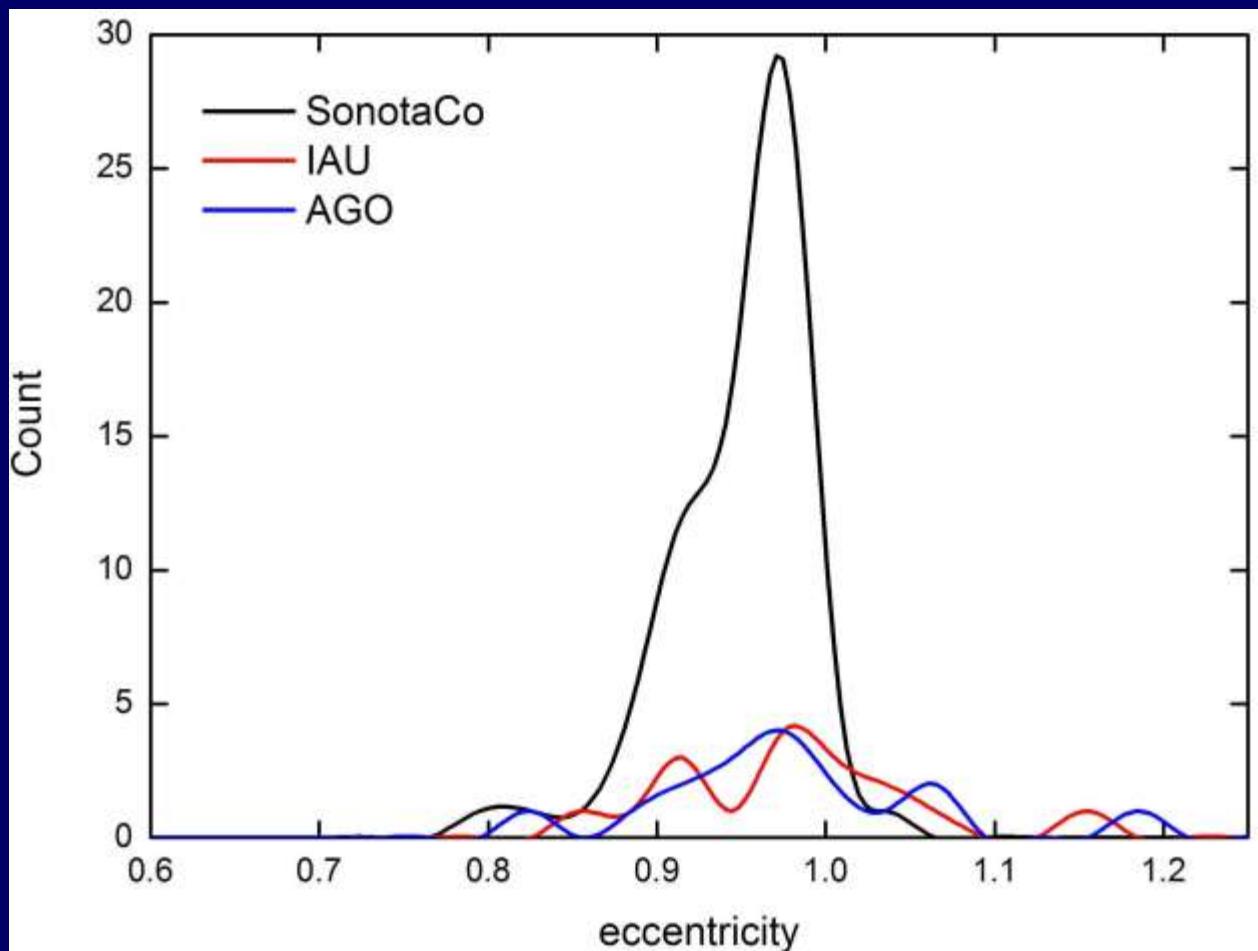

[sol=31.9 04/21]

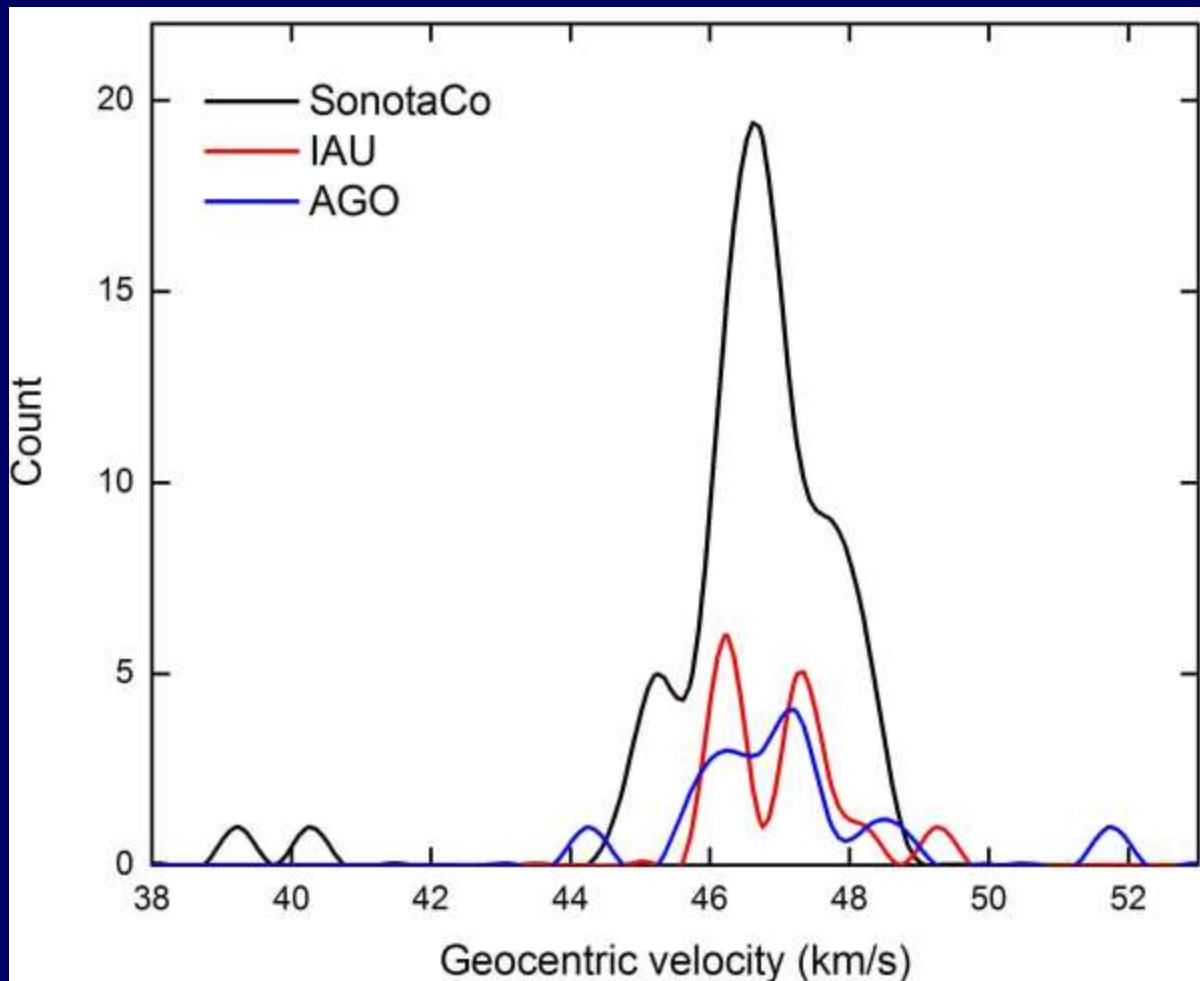

# Lyrids 2009

- results compared with two databases:
- precise photographic orbits IAU MDC (17)
- video orbits by SonotaCo (75)  
*(Vereš and Tóth, 2010, WGN, vol. 38, no. 2, p. 54-57)*
- All three datasets contains hyperbolic Lyrids:  
IAU MDC 35%,  
SonotaCo 8%  
SVMN data 35% Lyrids

**Table 1.** Mean values and standard deviations of the orbital elements, geocentric radians (eq. 2000.0) and velocities for the short (<200 years), long (>200 years) periodic and hyperbolic subset of observed Lyrid meteors on the base of Modra - Arboretum, April 21/22, 2009. The same parameters of the parent comet C/1861 G1 (Thatcher) are displayed for the comparison (Marsden 1989).
