# Status of the CAMS-BeNeLux network 

Martin Breukers<br>Carl Johannink<br>Paul Roggemans

## Status of the CAMS-BeNeLux network

CAMS = Cameras for All Sky Meteor Surveillance
= Professional project financed by NASA
= To validate the IAU Working List of Meteor Showers
= Running since November 2010
$=$ Totals $>\sim 250.000$ accurate meteor orbits

Single CAMS = Introduced by Pete Gural in June 2011
= Used for the Draconids 2011
= Play time for amateurs during Orionids 2011
= Start of CAMS-BNL in March 2012

CAMS-BNL Highlights from July 2014 till June 201 5:

- 189 Kappa Cygnids orbits associated in 2014, did the 2007 event repeat itself?
- 890 Perseid orbits (Full Moon 10 August 2014) > for a later topic
- Any trace of the 1567 Leonids dust trail?
- 528 Geminids orbits > for a later topic
- 163 Quadrantid orbits in 2015 , did we see the radiant contract?
- February a boring month meteor-wise?
- 86 Lyrids orbits in 2015
- June 201 5: Phi Piscids and Upsilon Andromedids orbits.

## Status of the CAMS-BeNeLux nełwork

$250 \mathrm{~K}-\mathrm{Cy}$ gnids
For the range
$\alpha \approx\left[220^{\circ}\right.$ to $\left.310^{\circ}\right]$
$\delta \approx\left[+39^{\circ}\right.$ to $\left.+74^{\circ}\right]$
$\mathrm{V}_{\mathrm{g}} \approx[12$ to $34 \mathrm{~km} / \mathrm{s}]$
$i \approx\left[16^{\circ}\right.$ to $\left.46^{\circ}\right]$
$\omega \approx\left[150^{\circ}-216^{\circ}\right]$
$\lambda_{\odot}\left[115^{\circ}-158^{\circ}\right]$
At right:
189 radiant positions
D-criterion < 0.105 with the associated sources according to the best $\mathrm{D}_{\mathrm{SH}^{-}}$-value

## Status of the CAMS-BeNeLux nełwork

Figure 1 - Denning's radiants in the CDC area with photographic radiants (solid diamonds; see Koseki 2009): azimuthal equidistant projection in ecliptic coordinates centered at $\left(\lambda-\lambda_{\odot}, \beta\right)=\left(160^{\circ},+75^{\circ}\right)$. The line $\lambda-\lambda_{\odot}=160^{\circ}$ runs along the y -axis. Ecliptic pole at $(\mathrm{x}, \mathrm{y})=(0,15)$. Intervals on axes marked in degrees.

Figure 5 - Koseki's 3 photographic meteor showers in the CDC area: asterisks are members of MK-74, stars are members of MK-83, and sharps are members of MK-84. For ellipses A-G see Figure 6.

## Status of the CAMS-BeNeLux network

Figure 6 - SonotaCo's video radiants 2007-12 in CDC area $120 \leq \lambda_{\odot}<160^{\circ}$. Meteor radiants concentrate in 7 ellipses A-G. Symbols are 2007 (plus), 2008 (asterisk), 2009 (cross), 2010 (triangle), 2011 (square), and 2012 (short bar).

The 2007 Kappa Cygnid event re-occurred in 2014.

## Status of the CAMS-BeNeLux network

189 radiant positions for 2014 with a $\mathrm{D}_{\mathrm{SH}}<0.105$ and the associated sources according to the best $\mathrm{D}_{\mathrm{SH}^{-}}$value, plotted in ecliptic coordinates relative to the groups previously described by Koseki (2014) splitted in three periods of time: at left $\lambda_{\odot}<130^{\circ}$, in the middle $130^{\circ}<\lambda_{\odot}<145^{\circ}$ and at right $\lambda_{\odot}>145^{\circ}$.
Based on the 131 K -Cygnid with $\mathrm{D}_{\mathrm{SH}}<0.105$, a radiant drift:
$\Delta \alpha / \Delta \lambda_{\odot}=+0.51^{\circ}, \Delta \bar{\delta} / \Delta \lambda_{\odot}=+0.59^{\circ}$. = much more than used in the IMO Shower Cal. Koseki (2014) has $\Delta \alpha / \Delta \lambda_{\odot}=+0.60^{\circ}, \Delta \delta / \Delta \lambda_{\odot}=+0.62^{\circ}$ (interval $120^{\circ}<\lambda_{\odot}<150^{\circ}$ ).

## Status of the CAMS-BeNeLux nełwork

## Any trace of the 1567 Leonids dust trail?

## Status of the CAMS-BeNeLux nełwork

## Quadrantids

38 cameras on 3-4 Jan. 2015 270 orbits, 143 Quadrantids of high quality.
Max.: January 4, at $2^{\text {h }}$ UT
27 cameras on 3-4 Jan. 2014 186 orbits, 125 Quadrantids of high quality.
Max.: January 3, at $20^{\text {h }}$ UT
IMO : $\alpha=230^{\circ}, \delta=+49^{\circ}$ 2014: $\alpha=229.6^{\circ} \pm 1.9^{\circ}$ and $\bar{\delta}=+49.8^{\circ} \pm 1.2^{\circ}$ (CAMS) 2015: $\alpha=230.6^{\circ} \pm 1.7^{\circ}$ and $\delta=+49.6^{\circ} \pm 1.0^{\circ}$ (CAMS)
Compact radiant, not diffuse!

## Status of the CAMS-BeNeLux nełwork

## Quadrantids

The information about a diffuse Quadrantid radiant with a very compact radiant nucleus during the peak hours appeared systematically in the IMO Shower Calendar as well as in the older Handbooks.

Prentice (1940) mentions "It is well known that the radiant of the quadrantid shower is exceedingly complex and apparently covers a wide area at least $20^{\circ}$ in diameter, with center about $230^{\circ}+50^{\circ} \%$. (This was the source of the information in the IMO publications).

In CAMS data we could not find any indication for a diffuse Quadrantid radiant. But the number of orbits beyond the maximum night is indeed small.

## Status of the CAMS-BeNeLux network

## Oh, so boring month of February

39 Cameras active, 21 partial clear nights, 777 orbits:
10 minor showers from the IAU Working list of Meteor showers could be identified.
427 FED (Feb. n-Draconids):

- 3-4 February 2011, CAMS in California registered 6 orbits; Nothing found with SonotaCo;
- Two very similar orbits by CAMS-BNL on 3-4 Feb. 2015;
- Nothing by CAMS California although perfect conditions;
- Very short duration source?

## Status of the CAMS-BeNeLux network

## Oh, so boring month of February

February Y-Lyrids? Outburst (radio) 2015 February $510^{\mathrm{h}}-11^{\mathrm{h}}$ UT.

- Canadian Meteor Orbit Radar: concentration at $\alpha=285^{\circ}$ and $\bar{\delta}=+35^{\circ}$.
- CAMS-BNL 38 cameras 4-5 Feb. 41 orbits, 5-6 Feb. 56, orbits 6-7 Feb. 116 orbits.
- Not any single orbit of CAMS-BNL matches the CMOR orbit.

429 ACB ( $\alpha$-Coronae Borealids):

- 2015 CAMS-BNL has 4 candidate orbits begin February, 2 end of January.
- D-criterion confirms 4 definitely belong to this minor shower.

506 FEV (February $\varepsilon$-Virginids):

- $\alpha=201.7^{\circ}, \bar{\delta}=+10.4^{\circ}, V_{g}=63 \mathrm{~km} / \mathrm{s}$.
- 2015 dataset CAMS-BNL has 3 orbits for this stream with a D-criterion 0.03-0.05. Activity from 2015 CA40? Marco Langbroek discovered a fast moving minor planet that possibly crossed the Earth orbit some 3000 years ago.
- Checking for slow meteors 20-24 Feb. from $\alpha=267^{\circ}, \delta=68^{\circ}$ and $V_{g}=8.1 \mathrm{~km} / \mathrm{s}$.
- No meteors match orbit of this object, neither CAMS-BNL nor CAMS in California.

## Status of the CAMS-BeNeLux network

## Lyrids 2015

An exceptional period with clear night allowed the CAMS-BNL network to function with up to 43 cameras during 27 nights, 11 of which were only partial clear. In total 1212 orbits were obtained this month. The Lyrid activity could be well monitored and 86 Lyrid orbits were identified with a D-criterion < 0.105 .

Rather diffuse radiant:

$$
\alpha=271 \pm 3 \text { and } \delta=+34 \pm 2\left(^{\circ}\right) .
$$

The radiant drift:
$\Delta \alpha=+0.78^{\circ}$ and $\Delta \bar{\delta}=-0.49^{\circ}$.

## Status of the CAMS-BeNeLux nełwork

## Conclusions

- July 2014 - June 2015: 13313 orbits (8355 July 2013 - June 2014).
- 30 cameras at the beginning of this period and 45 at the end;
- Kappa Cygnids had a comparable enhanced activity as in 2007
- Few orbits may have been obtained for the 1567 Leonid dust trail
- More orbits for 10 Minor Shower sources in February
- No indication for a diffuse Quadrantid radiant
- A diffuse Lyrid radiant
- Interesting dataset for Phi Piscids and Upsilon Andromedids

## Status of the CAMS-BeNeLux network

- Masahiro Koseki for his assistance to compare CAMS-BNL data with his analyses.
- Pete Gural for having created the single CAMS software and continuous support.

Thanks for your attention!

## Questions?

## Status of the CAMS-BeNeLux network

Table 1 - Comparing orbits from different sources for the Cygnid-Draconid-Complex. The CAMS-BNL dated, marked in bold, are compared with global CAMSdata, DMS data and sources described by Koseki (2014). The $\kappa$-Cygnids for CAMS-BNL ( ${ }^{*}$ ) marked in italics are all $\kappa$-Cygnids, including the 40 orbits which result in a slightly better $\mathrm{D}_{\mathrm{SH}}$ value for one of the minor streams.

| Stream | $\lambda_{0}$ | a | $\delta$ | V. | g | e | i | $\omega$ | Q | N | Source |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
